

PORTFOLIO SITEMAP & AI TOOLKIT SETUP

AI Fluency – Week 01: Draw the Path

Name: Yash B.

Institute: Rajiv Gandhi Institute of Petroleum Technology (RGIPT)

Branch: Electronics and Communication Engineering

Career Focus: Machine Learning / AI Engineering

1. Portfolio Proof Statement

My portfolio is designed to prove that **I can turn real-world problems into measurable and usable machine learning solutions**. The portfolio is primarily designed for **an ML Engineering Manager hiring an entry-level ML Engineer** who wants to evaluate whether I can apply machine learning to practical problems rather than only demonstrate theoretical knowledge. The main action I want the visitor to take is to **contact me for an interview**. Every section of the portfolio should therefore contribute to demonstrating practical ML ability, showing credible project evidence, and making it easy for the visitor to move toward an interview conversation.

2. Portfolio Sitemap

The portfolio uses a deliberately small sitemap so that every page has a clear purpose. The goal is not to include every possible piece of information, but to guide an ML Engineering Manager from understanding my capability to seeing evidence of that capability and finally contacting me.

Sitemap

HOME

WORK / CASE STUDIES

ABOUT

CONTACT

The Work section contains the selected projects and case studies that provide evidence for the main claim.

Home

The Home page is the entry point of the portfolio. Its primary purpose is to immediately communicate my main claim: that I can turn real-world problems into measurable and usable machine learning solutions.

The hero section should clearly state my ML engineering focus and direct the visitor toward my strongest project evidence. It should avoid unnecessary information and make it clear within a few seconds what I can contribute.

Page earns its place because:

The visitor needs to understand what I can do before evaluating the evidence.

Work / Case Studies

The Work section is the main evidence section of the portfolio. It will contain selected ML/AI projects rather than a long list of everything I have worked on.

Each case study should explain:

- The real-world problem
- The data or inputs involved
- The approach used
- The machine learning method or model
- The evaluation or measurable result
- What I learned
- The practical outcome or usefulness of the solution

Projects such as my machine-learning work and technical AI projects can be presented here when they directly support the main claim.

Page earns its place because:

The portfolio claim needs evidence. Projects and case studies demonstrate whether I can actually apply ML to practical problems.

About

The About page provides only relevant background that helps establish credibility.

It will briefly explain my background as an Electronics and Communication Engineering student at RGIPT, my interest in ML/AI engineering, and the technical direction I am developing through internships, projects, and learning.

The page will avoid becoming a complete biography.

Page earns its place because:

The intended visitor needs enough context to understand who created the work and why my background is relevant to an entry-level ML engineering role.

Contact

The Contact page provides the final action for the visitor.

The primary call to action will be:

Contact me for an interview.

The page will make it simple for an ML Engineering Manager or recruiter to reach me regarding an entry-level ML/AI opportunity.

Page earns its place because:

The portfolio is not only intended to demonstrate ability; it is intended to create an opportunity for an interview.

3. Why the Sitemap Is Small

I intentionally limited the portfolio to four main areas: Home, Work/Case Studies, About, and Contact.

I did not create separate pages for skills, achievements, certificates, blogs, testimonials, or other content because these are not necessary for the primary goal of the portfolio. Relevant skills and certifications can be demonstrated or mentioned within the existing pages when they strengthen the evidence.

The structure follows a simple path:

Understand my claim → See evidence → Understand my background → Take action

This keeps the visitor focused on the main purpose of the portfolio instead of making them navigate through unnecessary pages.

4. AI Toolkit Setup

For this assignment, I set up the required free AI toolkit:

- **ChatGPT** – used for learning, technical problem solving, coding assistance, and reviewing ideas.

- **Claude** – used as a tutor and portfolio-building collaborator.
- **Gemini** – configured as part of my AI toolkit for research and experimentation.
- **Perplexity** – configured as part of my AI toolkit for research and information discovery.

I also created a dedicated Claude Project for the portfolio build so that the project context and instructions remain available throughout the AI Fluency program.

5. Claude Project Configuration

Project Name

Yash Portfolio Build

The Claude Project is configured to act as a portfolio-building tutor rather than simply generating content for me.

The custom instructions include my proof statement and explain that Claude should challenge my decisions, identify unnecessary complexity, and evaluate whether each portfolio decision supports my intended audience and action.

Claude Project Custom Instructions

I am Yash B., an Electronics and Communication Engineering student at Rajiv Gandhi Institute of Petroleum Technology (RGPT), focused on developing my skills in Machine Learning and AI Engineering.

I am building a portfolio to demonstrate my ability to turn real-world problems into measurable and usable machine learning solutions.

My proof statement is:

“I can turn real-world problems into measurable and usable machine learning solutions.”

My intended audience is an ML Engineering Manager hiring an entry-level ML Engineer.

My intended action is for the visitor to contact me for an interview.

Act as my portfolio-building tutor throughout this project and help me develop the portfolio over the full AI Fluency program.

Do not simply agree with my ideas. Challenge unnecessary pages, weak evidence, vague claims, excessive content, and design or structure decisions that do not support my main claim.

Whenever I propose a portfolio decision, evaluate it against three questions:

1. Does it help prove my main ML engineering claim?
2. Does it help an ML Engineering Manager evaluate my ability?
3. Does it move the visitor toward contacting me for an interview?

Help me understand the reasoning behind your recommendations instead of simply making decisions for me.

When reviewing projects and case studies, focus on the problem, approach, technical reasoning, measurable results, practical usefulness, and evidence of my own contribution.

Keep the portfolio focused, credible, concise, and useful to a technical hiring decision-maker.

6. Claude Sitemap Pressure Test

After configuring the Claude Project, I used Claude to pressure-test my sitemap against my proof statement and intended action.

Prompt Used

I want you to pressure-test my portfolio sitemap against my proof statement and intended action.

My proof statement is:

“I can turn real-world problems into measurable and usable machine learning solutions.”

My intended audience is:

“An ML Engineering Manager hiring an entry-level ML Engineer.”

My intended action is:

“Contact me for an interview.”

My sitemap contains:

1. Home
2. Work / Case Studies
3. About
4. Contact

Evaluate this sitemap critically.

For each page, explain whether it directly contributes to proving my ML engineering claim, helping an ML Engineering Manager trust my ability, and moving the visitor toward the interview action.

Identify any unnecessary page or section that should be removed.

Also identify whether any important evidence is missing.

Finally, give me the single most important change you would make to this sitemap.

Do not be polite or simply agree with the structure. Pressure-test it as if you were an ML Engineering Manager evaluating this portfolio for an entry-level ML engineering candidate.

7. Pressure-Test Result

Claude's pressure test confirmed that the four-part structure is intentionally focused and that each major page has a clear role in the visitor's decision process.

The most important recommendation is to make the **Work / Case Studies section the strongest part of the portfolio** because the claim is about being able to apply machine learning to real-world problems. The portfolio should therefore prioritize evidence over simply listing technologies or certificates.

The pressure test also reinforced that the Home page should communicate the claim quickly and point visitors toward the strongest evidence, while the Contact section should provide a clear route toward an interview.

8. Change I Will Make

Based on the pressure test, I will make the **Work / Case Studies section more evidence-driven instead of creating separate pages for skills and certifications.**

Each selected project will focus on the real-world problem, my technical approach, the machine learning method, measurable results, and practical usefulness.

I will also keep the Home page concise and make the interview/contact action visible without adding unnecessary navigation.

This change makes the portfolio stronger because it directly supports the main claim: demonstrating that I can apply machine learning to real problems and produce measurable results.

9. Final Portfolio Path

The final visitor journey will be:

HOME

→ Understand what I can do

WORK / CASE STUDIES

→ See evidence that I can actually do it

ABOUT

→ Understand my background and credibility

CONTACT

→ Contact me for an interview

This path keeps the portfolio focused on one claim, one audience, and one action.

Conclusion

This assignment helped me translate my proof statement into a focused portfolio structure. Instead of creating pages based on everything I have done, I designed the sitemap around the specific decision I want an ML Engineering Manager to make.

The portfolio therefore focuses on one primary claim: **I can turn real-world problems into measurable and usable machine learning solutions.**

The selected structure provides a direct path from the claim to evidence and finally to the intended action of contacting me for an interview. Claude is being used as a tutor and critical reviewer so that future portfolio decisions remain aligned with this purpose.
