

WORKFLOW AUDIT

AI Fluency: Framework & Foundations

Name: Yash B.

Institute: Rajiv Gandhi Institute of Petroleum Technology (RGIPT)

Program: Electronics and Communication Engineering

Current Focus: Machine Learning, AI, Python, Internship Work, Technical Projects

1. Weekly Workflow Audit

The following tasks are recurring activities from my actual academic, internship, and technical-learning workflow. I classified each task based on how much human judgment, AI assistance, review, or automation is appropriate.

No.	Recurring Task	Classification	Rationale
1	Complete ML/AI internship assignments	Collaborate with AI	AI can help me understand requirements, structure the solution, and review my work, but I make the final technical decisions.
2	Debug Python and ML code	Collaborate with AI	AI can identify possible causes and suggest fixes, but I must test the solution and understand why the error occurred.
3	Learn new ML/AI concepts	Collaborate with AI	AI can explain difficult concepts with examples and different levels of detail, while I must practice and verify my understanding.
4	Research ML/AI topics and documentation	Delegate to AI with review	AI can quickly find and organize important information, but I need to verify technical claims and sources.
5	Summarize research papers and technical material	Delegate to AI with review	AI can create an initial summary efficiently, while I review it for accuracy and missing information.
6	Create GitHub README and project documentation	Delegate to AI with review	AI can convert my technical notes into structured documentation, but I need to verify all technical details.
7	Plan my weekly study and internship workload	Collaborate with AI	AI can help prioritize tasks and create a realistic plan, but I decide what I can actually complete.
8	Practice coding and DSA problems	Collaborate with AI	I should attempt problems independently first, while AI can provide hints, explanations, and feedback when required.
9	Prepare revision notes for academic subjects	Delegate to AI with review	AI can organize and simplify large amounts of material, but I need to check that important concepts are included.

No.	Recurring Task	Classification	Rationale
10	Prepare for technical exams and quizzes	Collaborate with AI	AI can generate practice questions and explanations, but I must solve the questions and evaluate my own understanding.
11	Decide my long-term career direction	Just me	AI can provide information and alternatives, but the final decision depends on my interests, abilities, goals, and personal circumstances.
12	Judge whether I genuinely understand a technical topic	Just me	AI can explain a concept, but I need to independently solve problems and explain the concept to determine whether I actually understand it.

2. AI Toolkit Setup

I configured the basic AI tools required for the AI Fluency workflow.

ChatGPT

My ChatGPT account is configured and used for activities such as technical learning, coding assistance, research, assignment planning, and reviewing solutions.

Claude

I created a Claude account and configured a Claude Project specifically for my AI Fluency and ML/AI work.

Claude Project:
My AI Fluency & ML Internship Assistant

Anthropic Academy

I enrolled in **AI Fluency: Framework & Foundations** through Anthropic Academy and completed at least the first module.

Evidence: Screenshots of the account/course progress are included at the end of this document.

3. Claude Project Configuration

I created a Claude Project to maintain consistent context while working on my academic, internship, and AI-learning tasks.

Custom Instructions

I am an Electronics and Communication Engineering student at Rajiv Gandhi Institute of Petroleum Technology (RGIPT) and I am working on an ML/AI internship. My current focus areas are machine learning, Python, AI, data analysis, and technical projects. I am also completing AI Fluency assignments and internship assignments.

Help me understand concepts rather than simply giving me answers. When helping with technical work, explain the reasoning, identify assumptions, and point out possible errors. For coding tasks, help me debug and understand the cause of errors instead of only providing replacement code.

Prefer clear, structured, concise explanations with practical examples. For assignments, follow the exact requirements and evaluation criteria. Do not invent information. Clearly distinguish between facts, assumptions, and suggestions.

My current goals are to improve my ML/AI skills, complete my internship assignments successfully, build useful technical projects, and become better at independently solving technical problems.

4. Three Target Tasks for FL-02 to FL-04

I selected three tasks from the workflow audit that I can repeatedly use in the following AI Fluency assignments.

Target Task 1: ML/AI Internship Assignment Completion

Task:

Use AI to help understand, structure, implement, and review ML/AI internship assignments.

How AI will help:

- Understand assignment requirements
- Break large tasks into smaller steps
- Explain unfamiliar concepts
- Review code and reasoning
- Identify possible mistakes

What I remain responsible for:

- Making final technical decisions
- Testing the solution
- Verifying correctness
- Understanding the submitted work
- Completing the final submission

Definition of done well:

The assignment is complete when **100% of the stated requirements are addressed, the implementation works without unresolved errors, and I can independently explain the submitted solution and reasoning.**

Target Task 2: Python/ML Debugging

Task:

Use AI to diagnose and fix Python or machine-learning coding errors while understanding the underlying cause.

How AI will help:

- Analyze error messages
- Identify possible causes
- Suggest debugging approaches
- Explain unfamiliar Python/ML behavior
- Review the final implementation

What I remain responsible for:

- Running and testing the proposed solution
- Confirming that the fix actually works
- Understanding the cause of the error
- Checking that the fix does not introduce another problem

Definition of done well:

The task is complete when **the code executes successfully, produces the expected output, and I can explain the cause of the error and why the implemented fix works.**

Target Task 3: ML/AI Research and Technical Learning

Task:

Use AI to understand ML/AI concepts and summarize technical papers, documentation, and learning resources.

How AI will help:

- Explain difficult concepts
- Break down technical material
- Identify important ideas
- Organize information into notes
- Generate examples and practice questions

What I remain responsible for:

- Verifying important technical information
- Checking original sources when necessary
- Practicing the concepts independently
- Deciding whether I actually understand the topic

Definition of done well:

The task is complete when I can produce **a concise and accurate 1–2 page summary containing the main problem, approach, important concepts/results, and at least three key takeaways, and can explain the topic independently.**

5. Key Learning from the Workflow Audit

This audit showed me that AI should not be treated as a replacement for my own work. Different tasks require different levels of AI involvement.

For repetitive information-processing tasks, AI can save significant time. For technical tasks such as debugging and learning, collaboration with AI is more appropriate because I still need to understand and verify the result. For decisions involving my personal career direction or whether I genuinely understand a subject, the responsibility should remain with me.

The three selected target tasks will allow me to test and improve my ability to work with AI throughout the next phases of the AI Fluency program.

6. Evidence

Evidence 1 – ChatGPT Account

Evidence 2 – Claude Account / Claude Project

Evidence 3 – Claude Project Custom Instructions
