

# FlyRank AI Fluency — Framed Cases

## Voice Card

**Direct, specific, simple, honest, technical, no buzzwords**

---

## Case 1 — Search Ranking Improvement

### The Problem

My internship task was to work on **search ranking improvement**. The existing ranking pipeline had a significant gap between its baseline performance and the reference model, so the first step was to understand where the gap came from.

### What I Did

I selected Search Ranking Improvement as my internship lane and worked through the discovery notebook. I inspected the existing pipeline and compared the baseline performance with the model performance. The baseline was around **0.24**, while the reference model was around **0.74**.

Instead of immediately trying a complex solution, I first focused on understanding the existing workflow and defining the ML problem.

### What Came of It

I got a clearer understanding of the actual ranking problem and the importance of establishing a baseline before attempting improvements.

---

## Case 2 — ML Task Framing

### The Problem

“Improve search ranking” is too broad to directly build a machine-learning solution. I needed to turn the internship problem into a clearly defined ML task.

### What I Did

For **W01 and W02**, I worked on defining the research question and mapping the Search Ranking Improvement problem onto the ML workflow.

I focused on identifying the problem, expected output, data, model task and evaluation rather than jumping directly into algorithms.

## What Came of It

I learned how to convert a broad engineering problem into a machine-learning problem that can be tested and evaluated.

---

## Case 3 — First Readable ML Model

### The Problem

After understanding the existing pipeline, I needed to move from discovery toward building and understanding a basic model.

### What I Did

I worked through the **first readable model notebook**, focusing on how the data, features, model and evaluation fit together.

The goal was to understand the complete workflow rather than treating the model as a black box.

### What Came of It

I became more comfortable with the basic ML loop:

**Problem → Data → Features → Model → Evaluation → Improvement**

This gave me a foundation for further experiments on the ranking problem.

---

## Case 4 — AI Workflow Audit

### The Problem

Another part of the internship involved understanding how AI should fit into my own workflow rather than simply using AI to generate answers.

### What I Did

I identified recurring tasks and considered which tasks could be delegated to AI and which required my own judgment. I also worked through the AI Fluency concepts around **Delegation, Discernment and Diligence**.

### What Came of It

I developed a more deliberate approach to using AI: let AI handle suitable work, but keep important decisions, verification and accountability with me.

---

## Bio

I am an ECE student at RGIPT working on machine learning and AI. During my FlyRank internship, I have been focusing on search ranking, ML problem framing and building a better understanding of the ML workflow.

## Contact / CTA

I am interested in ML/AI internships, projects and opportunities to work on practical machine-learning problems.

---

## Before / After

### Before — Generic AI

“I leveraged cutting-edge machine learning techniques to develop an innovative solution for improving search ranking.”

### After — My Version

“I first compared the existing ranking baseline with the reference model to understand the performance gap before deciding how to improve it.”
